

RollNRack Unit

Prevent injuries and extend your valuable manpower while transporting and loading your fire hose. After hose is drained, it is manually rolled and the coupling is left at 12:00. Facing the open coupling, the hose roll is rocked onto the RollNRack unit and wheeled to the rig. Hose is loaded with just two firefighters in under a minute a roll, while never lifting rolls of hose (LDH) off the ground. Use the RollNRack to safely load all hose up to 5" LDH.
